BEFORE REMOVING THE TRANSMISSION!

It is important to mark the timing sensor located between the back of the engine and the transmission. It is important to mark this so it can be placed back in the same offset to the time wheel on the back of the flywheel. If the sensor is placed too far down on the mount it may interfere with the time wheel and damage it. If the sensor is too far up the mount it may cause the engine to misfire. It is a safe idea to remove the sensor before removing or installing the transmission so it is not damaged in the process.
